Remote Patient Management

Enabling remote care of patients in the community

Orion Health Remote Patient Management (RPM) strengthens a patient's support system to keep them in optimal health. It provides an engagement and empowerment tool that optimizes community patient care. As a comprehensive solution, on top of Orion Health Amadeus, RPM provides the communication platform for patient and care teams to collaborate. It enables the ability to take preventive action, to reduce Emergency Department (ED) visits, hospitalizations and the average hospital length of stay, reducing the cost to the healthcare system. The RPM solution enables care providers to tailor a personalized monitoring plan for individual patients by offering the most complete set of tools and data connections to power effective virtual care across multiple settings.

What is RPM?

As a comprehensive solution built on top of Orion Health Amadeus, RPM enables remote care of patients in the community. Many of these patients have chronic illnesses which require continuous monitoring and the platform to strengthen the patient's support system to prevent avoidable hospital admissions. From their home, the patient's either use an electronic tablet provided by their healthcare provider, or access services through a web browser via their personal computer, tablet or phone.

Using the personal health assistant, patients register their routine daily health and medication activities, personalized by their care provider. While executing their precise monitoring plan, patients receive real-time feedback and educational material. Health activities can include reviewing their vital signs, signs, and symptoms of deteriorating health, all of which are specific to the patient's conditions. The result is an engagement and empowerment tool that optimizes a patient's health. The solution also offers administration capabilities for the creation and modification of monitoring plans.

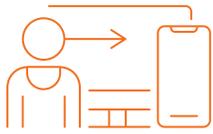

Remote Patient Management provides the means for patients and clinicians to engage in virtual care from the patient's home. RPM allows patients to take control of their healthcare, improving their quality of life and sense of security. For healthcare organizations, it reduces avoidable ED and hospital visits, especially for frequent flyers. Simply put, patients monitored and cared for in their homes, decreases costs for the healthcare system and provides a positive return on investment.

Solutions

Improves patient health, quality of life and sense of security

RPM enables care providers to tailor a personalized monitoring plan allowing clinician to monitor specific medical conditions and comorbidities. The monitoring plan is composed of scheduled routine health activities, helping patients learn how to recognize early symptoms of an exacerbation and to self-manage. By executing health activities, patients come to understand the cause and effects of adopting healthier behaviors. This helps patients to better understand and manage signs and symptoms and to know when to reach out for help, giving them a sense of security about their condition.

Provides monitoring and management of patients in their own home

Patients use the technology platform to register their daily health activities following their personalized care plan. These health activities can include reviewing their vital signs and looking for signs and symptoms of deteriorating health. Health status is captured from the patient's home and updated to the platform, providing essential information to improve clinical decision-making when clinicians adjust and optimize treatments.

Ability to monitor patient medication adherence

With seamless integration with Orion Health Medicines, RPM draws medication data from the medication profile and allows clinicians to generate medication adherence reports. Patients record when they have taken their medication as well learning the associated symptoms to manage. Medication adherence is important for patient wellbeing and RPM supports patients to adopt and understand their specific medication regimen routine.

Empowers patients to take responsibility for their own healthcare

RPM programs have shown that when patients are given the tools to take control of their own healthcare, they do so willingly. Provided with resources to learn more about their condition patients can view educational presentations and videos. Learning and repeating positive health behaviors through interactive health activities improves the understanding of their health conditions. RPM empowers patients to take responsibility for their own healthcare.

Help to reduce ED visits, hospitalizations and hospital length of stay

The triage facilities identify patients who need help and input from a clinician, the patient-generated clinically valid data is a key part of the chain of a prevention strategy. Changes in vital signs can be indicators of a patient's health deteriorating. With RPM vital signs are collected and monitored closely providing patients and clinicians with early warning indicators, allowing time to reverse any trends and prevent deterioration leading to avoidable ED visits and hospitalizations.

Strengthens a patient's support system

Improved communication with the patient's circle of care, including family caregivers, helps to create a stronger support system for patients. By supporting family caregivers' understanding of the patient's care plan, this enables them to become involved actors and provide appropriate support.

Future-proof your journey from Population Health to Precision Medicine.

Every step you take towards delivering personalized healthcare is valuable. Our end-to-end solution, built on our Amadeus platform, with inclusive real-time analytics, clinical, patient engagement and enterprise applications, will future-proof your journey.
