

# care pathways

Standardize care for entire population cohorts,  
while enabling a personalized and precise  
approach to individual patient care.

---

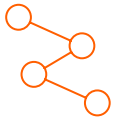

Orion Health Care Pathways enables optimized workflows to support the management and track the delivery of programs of care. The Care Pathways solution provides fundamental models of care aligned to an array of treatment best practice guidelines. Care Pathways supports a wide range of task demands, from risk assessments to highly sophisticated predictive workflows that follow individual patients through their care programs.

The increasing cost and complexity of managing patients with risk factors and conditions is driving a fundamental shift in patient management. For healthcare providers, these changes present new challenges, such as, how to manage new models for delivering sophisticated interactions and how to coordinate and communicate across the entire patient journey. Collaboration between all members of a patient's care team is vital, with the ability to document, store and track programs of care. These programs need precise descriptions of the care delivered (or to be provided) for each patient and to ensure consistent care delivery occurs across all the patients in a program.

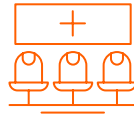

Care Pathways streamlines the patient's journey, providing the tools care providers need to manage communication, workflows, and track the patient's needs. Care Pathways can be seamlessly implemented throughout the healthcare system, within a hospital, ambulatory settings and across an entire community. Enabling care providers to make informed decisions, with the identification of care interactions at the right time based on local care requirements. By delivering the care an organization's models of care demands, outcomes are met, gaps in care are closed, clinical collaboration increases and best practice standards are maintained, this enables precise care and improved patient care outcomes.

# Benefits of Care Pathways

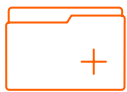

## Organize complete care models

Organizations can design and manage clinical pathways and care delivery models across the care continuum. A range of predefined evidence-based clinical workflows, assessments, clinical documents and predictive pathways (with associated lists and views) are available; for example, the Transition of Care and Care Coordination pathways. Organizations can also tailor Care Pathways for their care coordination requirements.

## Reduce hospital admissions

Reduce hospital admissions, readmissions, and missed appointments, as care is streamlined and gaps in care identified and tracked. Care Pathways provides additional management tools – rule-driven reminders, prompts, and alerts. These tools support organizations in improving compliance with known models of care, meeting best practice, or local care requirements. Tasks assigned to specific users give the care team the ability to monitor compliance and identify and address any care gaps.

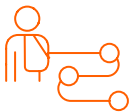

## Leverage care records

Leverage and contribute to integrated care records that support information flows. Care providers can enroll patients on one or multiple pathways at any time. Each Care Pathway can be managed separately, and this enables the care record to be viewed and updated by all the members of the patient's care team.

## Bring the care team together

Bringing the care team together and support the multidisciplinary care delivery models your organization requires; for example, Coordinators can have the tools they need to identify and track cohorts and or individual patient adherence to care delivery workflows and intervene in a timely manner to prevent or overcome gaps in care.

## Treat patients at the right place and time

Treat patients at the right place and right time by the right professional. Care Pathways provides the tools needed to deliver a streamlined patient journey – with the patient being at the centre of their care.

## Standardize processes

Care Pathways helps to standardize policy, procedures, and processes within and across healthcare organizations, while allowing flexibility where care is delivered. Organizations have the option to leverage the pre-built Care Pathways to suit their specific needs. There is a library of pathways that can be utilised. Library examples are The Care Coordination Pathway which encompasses general assessments, these include, social and lifestyle factors, to risk assessments to capture outcome scores; PHQ, KATZ, and STEADI to providing the patient with a personalized care plan and education assessments.

# Key Features

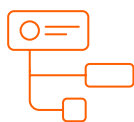

## Tasks to do the right thing, at the right place, at the right time

Tasks, the backbone to interactions with patients, are simple to configure and allocate. Tasks (including actions or sophisticated best practice assessments) can be scheduled, repeated, assigned, or grouped with other tasks to form Care Pathways.

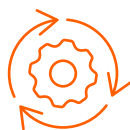

## Create flexible forms and interact with the entire care team

Smart and flexible forms enable fast and accurate entry of information. Interactive web forms can be effortlessly completed, and incorporate a rich variety of features, including; field validation, show and hide multiple sections, image annotation, and attachments that come as part of the clinical review.

## Care Pathways the entire care team can engage with

Care Pathways are groups of tasks that act as a cohesive program of care for patients. Built using a simple pathway designer within Orion Health Coordinate, Care Pathways drive more consistent and predictable patient workflows. Organizations can create any number of Care Pathways, ranging from short-term to condition management over a patient's lifetime. As a result, we can build and configure your pathways to meet organizational requirements and standards, which enable a precise approach to patient care and treatment.

## Flexible workflow tools for responsive care pathways

Flexible workflow tools include Business Process Management (BPM), which enables the configuration of Care Pathways based on best practice models and guidelines meeting industry standards. Workflows can be structured in a flow chart format, permitting users to visualise and verify workflows, allowing for easy validation by subject matter experts.
