

# Care Pathways

Care Pathways is a tool kit for building patient care workflows across the healthcare continuum.

Design clinical pathways to meet local requirements

Enroll patients on clinical pathways

Manage patient tasks

Design and manage forms

Display data captured from patient forms

Query data captured from patient forms from the data repository

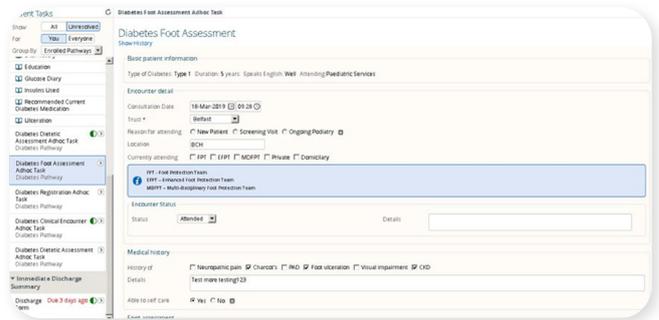

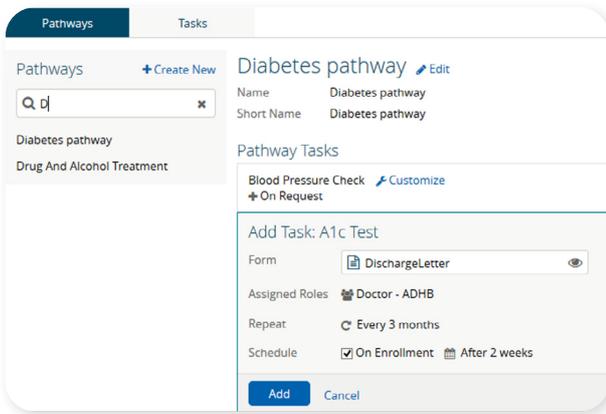

Integrate Orion Health products using APIs

Share files securely

Care Pathways provides the clinical, administration and patient-focused tools that are required to manage and optimise the care of patients. The scope of possible solutions ranges from simple, local clinical workflows to the management of chronic care patients being treated across multiple providers. Care Pathways can manage patients as part of basic clinical workflows through to chronic condition patients with complex care requirements. Care Pathways utilises components of Workflow designers, Orion Health Tasks, and Forms tools (design and display).

# Key Features

## Design Pathways

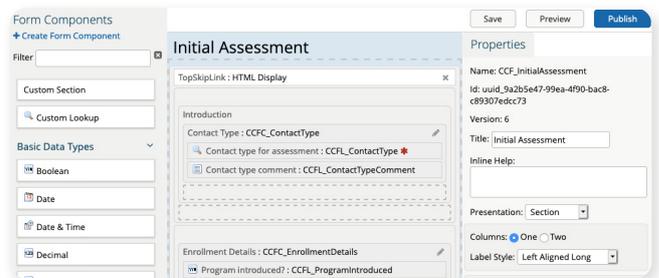

Care Pathways contains two tools for designing clinical pathways:

- Pathway Designer – Allows administrators to design simple pathways.
- Business Process Management – Allows administrators to design more complex pathways. Tasks can be scheduled depending on completion of other tasks, on patient demographics (such as gender or age) or on data entered into other tasks.

## Pathway Management and Permissions

Patient management using Care Pathway pathways are based on best practice guidelines and industry standards while still being configurable to meet local requirements. Care providers (or systems) can enroll patients on to pathways, track and manage required activities, and track the progress of outcomes for patients.

Pathways can be restricted so only specific groups of users can perform actions on a particular pathway.

## Task Management

Task management features provide assignment and visibility of tasks:

- The patient-centric Task List provides a central location for outstanding and upcoming tasks across disciplines of patient care.
- The Task List view can be customised to show historical tasks for the patient and filtering options can be applied.
- The Task List can be grouped by due date or by pathway enrolments.

## Form Controls and Customisation

Forms provides a wide range of controls to enable fast and accurate entry, and completion of clinical or administrative information.

The Form Designer allows administrators to create and modify versioned form definitions. They can create, search for, and maintain forms and form components. The publication workflow allows administrators to create, save, and modify forms before formal publication when the form is made available for use.

### Advance Directive

Description	Most Recent Value	Last Modified By	Last Modified Date
Advance Directive	No	Taylor NIGHT	31-Jan-2020

Pet(s)	No	Taylor NIGHT	31-Jan-2020
Smoking status	No	Taylor NIGHT	31-Jan-2020

## Display Captured Form Data

Care Pathways data and events can be used with other Orion Health products to contribute to a concise longitudinal patient Record. Clinical Portal Generic Search and Document Tree functionality can be used to expose data and documents.

Summary and overview pathway information can be displayed on dashboards. These dashboards provide fast access to information and actions for pathway and task management.

## Integration

Care Pathways provides a number of APIs that can be used in conjunction with other Orion Health products to integrate Care Pathways data and actions into a wider solution. The APIs provide the following types of messages:

- Task events
- Pathway events
- Document saves

## Data Repository

Data captured using Care Pathways forms is stored in the data repository. This is a generated, relational database that can be queried using standard relational database query and reporting tools.

Shared form components can be configured to store their data in a common location which can be easily queried.

## Shared Files

Care Pathways contains standard features that allow for a variety of deployment scenarios:

- Auditing
- Internationalisation
- Clustering
- Web-Based Interface

# Benefits

## Leverage care records

Leverage and contribute to integrated care records that support information flows. Care providers can enroll patients on one or multiple pathways at any time. Each Care Pathway can be managed separately, and this enables the care record to be viewed and updated by all the members of the patient's care team.

## Organise complete care models

Organisations can design and manage clinical pathways and care delivery models across the care continuum. A range of predefined evidence-based clinical workflows, assessments, clinical documents and predictive pathways (with associated lists and views) are available; for example, the Transition of Care and Care Coordination pathways. Organisations can also tailor Care Pathways for their care coordination requirements.

## Reduce hospital admissions

Reduce hospital admissions, readmissions, and missed appointments, as care is streamlined and gaps in care identified and tracked. Care Pathways provides additional management tools – rule-driven reminders, prompts, and alerts. These tools support organisations in improving compliance with known models of care, and meeting best practices or local care requirements. Tasks assigned to specific users give the care team the ability to monitor compliance and identify and address any care gaps.

## Bring the care team together

Bring the care team together and support the multidisciplinary care delivery models your organisation requires; for example, Coordinators can have the tools they need to identify and track cohorts and/or individual patient adherence to care delivery workflows and intervene in a timely manner to prevent or overcome gaps in care.

## Treat patients at the right place and time

Treat patients at the right place and right time by the right professional. Care Pathways provides the tools needed to deliver a streamlined patient journey – with the patient being at the center of their care.

## Standardise processes

Care Pathways helps to standardise policies, procedures, and processes within and across healthcare organisations, while allowing flexibility where care is delivered. Organisations have the option to leverage the pre-built Care Pathways to suit their specific needs. There is a library of pathways that can be utilised. Library examples include from the Care Coordination pathway, which encompasses general assessments (including social and lifestyle factors), to risk assessments that capture outcome scores (PHQ, KATZ, and STEADI). These help provide the patient with a personalised care plan.

---

## Future-proof your journey from Population Health to Precision Medicine.

Every step you take toward delivering personalised healthcare is valuable. Our end-to-end solution—built on our Amadeus platform with real-time-analytics, clinical, and patient-engagement will future-proof your journey.
