

# Breast Screening

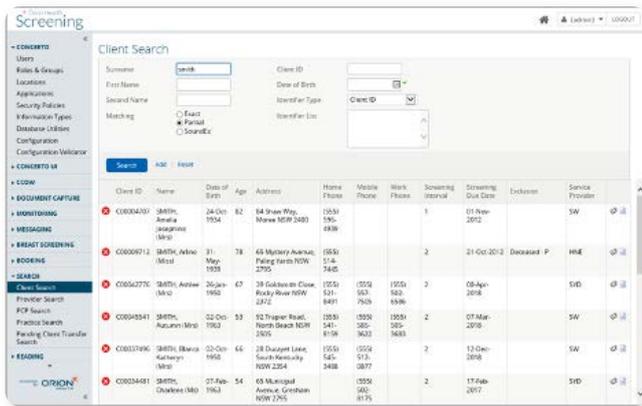

An integrated solution to support digital mammography-based breast screening and enable early detection of breast cancer

-  Grow client recruitment and participation in breast screening
-  Increase screening of at-risk populations
-  Enrich the experience and improve client engagement
-  Strengthen accuracy of reports with a double blind reading system
-  Drive data accessibility with a shift to cloud computing
-  Enhance efficiencies and minimise costs through automation

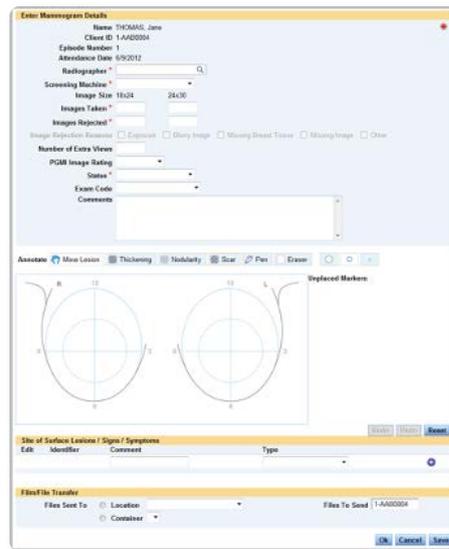

A component of the Orion Health Coordinate solution, Breast Screening provides the integrated workflow to fully manage the specific clinical, administrative and business processes for digital mammography-based breast screening programs for entire population cohorts. It starts with client enrolment, moving to the identification and management of at-risk populations and providing a streamlined clinical workflow, that enables a multi-provider service to work through one shared database.

# Key Features

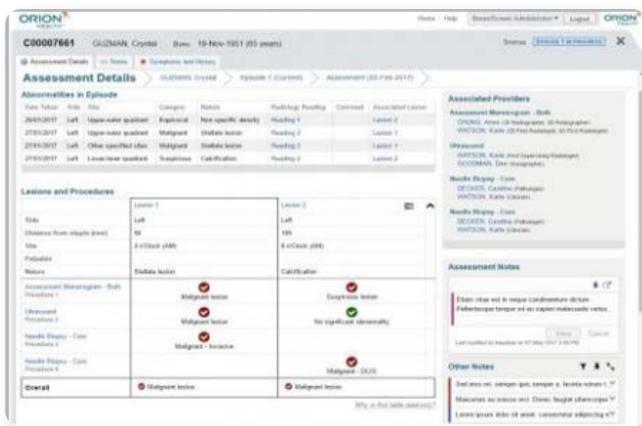

## Effective client management

Clients can be invited manually or via pre-designed rules, then scheduled and booked, with the option of self-booking via the public web module. Purpose-built breast cancer screening workflows simplify the operational management with practical scheduling and reminder functionality to drive efficiencies across the booking process. There is an improved user experience for administrators with a reduced number of screens and clicks required, helping to minimise manual errors.

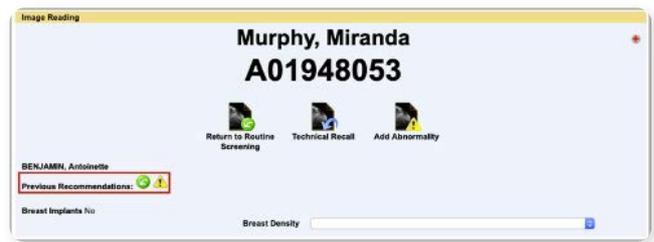

## Appropriate screening and assessment

Population management workflows simplify the task of ensuring the target population is screened, providing at-risk clients screenings at appropriate times. The screening and assessment functionality facilitates all aspects of the process; including image annotation, clinical examination and procedure management plus, picture archiving and communication system integration. In acknowledgement of the Orion Health Breast Screening solution, BreastScreen Australia has accredited the National Accreditation Standard to the solution.

## Constructive reporting and outputs

The reporting functionality facilitates the management of mandatory and non-mandatory reporting requirements. The breast screening outputs enable letters, appointment confirmations and assessment outcome reports. The data collection and reporting functionality simplify the task of reviewing and reporting data captured in the solution, harnessing this vital information for ongoing research.

## Unique double blind reading system

Orion Health Breast Screening enforces a double-blind reading system, where two radiologists view the mammograms independently. If the two readings are concordant, the assessment is complete. If the two readings are discordant, a third reader will review and determine the final evaluation. This unique feature provides a level of accuracy and accountability in the breast screening process, which can give users and clients confidence in the system.
